

Show your brand name on “Continue with Google”

Setup guide for white-label institutes on Vacademy · September 2026

When your learners click **Continue with Google**, Google shows a sign-in screen that names the app they are signing in to. By default that name is **vacademy.io**. After this setup it shows **your brand’s name**.

BEFORE

Choose an account to continue to
VACADEMY.IO

AFTER

Choose an account to continue to
YOUR BRAND

Before you start

- **Time:** about 30 minutes of setup, then 2–3 working days while Google reviews your app.
- **A Google account** that will own the setup. Use a company account that will not be deleted, not a personal one.
- **Access to your domain’s DNS** (GoDaddy, Cloudflare, Hostinger...), to add one TXT record.
- **A public website** for your brand that shows your brand name and has a footer where you can add a link.
- **Admin access** to your Vacademy admin dashboard. You paste the result there at the end.

Keep these values handy

Authorized redirect URI	<code>https://backend-stage.vacademy.io/login/oauth2/code/google</code> Also shown, with a Copy button, in Vacademy admin → Settings → White-Label Setup → Google sign-in branding.
Vacademy account to add as Owner	<code>developer@vidyayatan.com</code>
Authorized domains	Your website’s domain (for example <code>yourbrand.com</code>) and <code>vacademy.io</code>
Privacy policy URL	<code>https://<your learner portal>/privacy-policy</code> For example <code>https://learn.yourbrand.com/privacy-policy</code> . Vacademy already hosts this page in your brand’s name.
Scopes	<code>openid</code> , <code>userinfo.email</code> , <code>userinfo.profile</code> and nothing else

The screenshots below come from a real setup. Private details are blacked out.

1 Create a Google Cloud project

1. Open `console.cloud.google.com/projectcreate` while signed in to the Google account that will own the setup.
2. **Project name:** your brand name. **Parent resource:** leave as it is.
3. Click **Create**, then check that the new project is selected in the project picker at the top of the page.

2 Add Vacademy as a project Owner

Google sign-in finishes on `vacademy.io`. Google only approves your app if a project owner has verified that domain, so our account later has to be an owner of your project.

1. Go to **IAM & Admin** → **IAM** → **Grant access**.
2. **New principals:** `developer@vidyayatan.com`. **Role:** Basic → **Owner**. Click **Save**.
3. Tell your Vacademy contact. We accept the invitation, and the warning icon next to “Owner” disappears.

3 Start the OAuth consent screen

1. Go to **APIs & Services** → **OAuth consent screen** and click **Get started**.
2. **App name**: your brand exactly as it is written on your website. Google checks that the two match.
3. **User support email**: pick your email. **Audience**: **External**. **Contact information**: your email.
4. Accept the Google API Services User Data Policy, then click **Create**. The left menu now shows Branding, Audience, Clients, Data Access and Verification Center.

4 Fill in Branding

1. **App logo**: square, 120 × 120 px, PNG or JPG, under 1 MB.
2. **Application home page**: your public website, for example `https://yourbrand.com`. Use a page that works without logging in.
3. **Application privacy policy link**: `https://<your learner portal>/privacy-policy`.
4. **Authorized domains**: click **Add domain** twice: your website's domain, and `vacademy.io`.
5. **Developer contact information**: your email. Click **Save**.

5 Add the three sign-in scopes

1. Go to **Data Access** → **Add or remove scopes**.
2. Tick `.../auth/userinfo.email`, `.../auth/userinfo.profile` and `openid`. Tick nothing else: any other scope turns a 3-day review into a review of several weeks.
3. Click **Update**. The three scopes appear under “Your non-sensitive scopes”. Click **Save** at the bottom of the page.

Don't type the scopes into the **Filter** box: several filters together match nothing and the table looks empty.

Tick exactly these three.

After Update: three non-sensitive scopes, no sensitive or restricted ones.

6 Create the OAuth client

1. Go to **Clients** → **Create client**. **Application type**: Web application. **Name**: anything, for example “Vacademy sign-in”.
2. Leave **Authorized JavaScript origins** empty.
3. **Authorized redirect URIs** → **Add URI**: `https://backend-stage.vacademy.io/login/oauth2/code/google`. Paste it exactly, with no space and no trailing slash.
4. Click **Create**, then click **Download JSON** in the dialog. **Google shows the client secret only once**.

Don't send the client secret by email or chat. You paste it yourself into the Vacademy admin dashboard in step 11.

7 Verify your domain in Google Search Console

1. Open `search.google.com/search-console` with the same Google account.
2. **Add property** → **Domain** (the left option), enter only your domain, for example `yourbrand.com`, then click **Continue**.
3. Copy the TXT record (`google-site-verification=...`) and click **Verify later**. Don't click **Remove property**.
4. At your DNS provider, add a **new** record: **Type** TXT, **Name** @ , **Value** the copied text. Leave existing records, especially email (SPF) records, untouched.
5. Back in Search Console, click **Verify**. If it fails, wait up to an hour for DNS to update and try again.

8 Link the privacy policy from your website

Add a footer link on your home page: **“Privacy Policy”** → `https://<your learner portal>/privacy-policy` . Google rejects apps whose home page does not link to the same privacy policy as the consent screen. A policy for another app doesn't count.

9 Publish the app

Go to **Audience** → **Publish app** → **Confirm**. The publishing status changes from “Testing” to **“In production”**. While it is in Testing, only listed test users can sign in and everyone else sees “Access blocked”.

10 Submit for brand verification

1. Go to **Verification Center** and submit your app for (brand) verification.
2. Google usually replies by email within 2–3 working days. Answer any questions quickly, because an unanswered email pauses the review.
3. Until Google approves, the sign-in screen keeps showing **vacademy.io**. That is expected.

11 Paste the client into Vacademy

1. When Verification Center shows **Verified**, open Vacademy admin → **Settings** → **White-Label Setup** → **Google sign-in branding**.
2. Paste the **Client ID** and the **Client secret** from the JSON file, keep **Use this client for Google sign-in** on, and click **Save**.
3. Wait 5 minutes, open your learner portal in a private window and click **Continue with Google**. Google should now show your brand's name.

To go back to the default screen at any time, switch **Use this client for Google sign-in** off, or click **Remove**. Existing learner accounts keep working either way.

Troubleshooting

What you see	What to do
“Access blocked: this app’s request is invalid” or “Error 400: redirect_uri_mismatch”	The redirect URI in your OAuth client is not exactly <code>https://backend-stage.vacademy.io/login/oauth2/code/google</code> . Fix it under Clients and wait 5 minutes.
“Access blocked: ... has not completed the Google verification process”	The app is still in Testing. Do step 9, Publish app.
The screen still says vacademy.io	Google has not finished verification (step 10), or the client was saved in Vacademy less than 5 minutes ago.
Google rejected verification: home page or privacy policy	The app name must appear on your home page, the home page must work without logging in, and its footer must link to the same privacy policy URL (step 8).
Google rejected verification: domain ownership	Both authorized domains must be verified in Search Console by a project owner: yours (step 7) and vacademy.io (our account from step 2 must be an Owner).
Sign-in fails after saving in Vacademy (“invalid_client”)	The client secret was mistyped or regenerated. Paste it again in Vacademy, or switch the client off to fall back to the default.
